APPEAL BRIEF

This is an appeal from the Final Rejection dated February 14, 2007 finally rejecting claims 2 to 4. Claims 2 to 4 are being appealed, claims 1 and 5 to 8 having been withdrawn from consideration but subject to rejoinder. The appealed claims are set out in Appendix J. Appellants filed a Notice of Appeal pursuant to 37 C.F.R. § 1.191 on June 25, 2007.

(C) Real Party In Interest

The owner of the present application and the invention contained therein is
ROHM AND HAAS COMPANY.

10/630,282

A01395

(D) Related Appeals, Interferences or Judicial Proceedings

No appeals, interferences or judicial proceedings are known to Appellants, the Appellants' legal representative, or the assignee which will directly affect or be directly affected by or have a bearing on the Board's decision in the pending appeal.

10/630,282

A01395

(E) Status Of Claims

The status of the claims is as follows:

Claims pending: 2 - 4

Allowed claims: none

Claims objected to: none

Claims canceled: none

Claims rejected: 2 - 4

Claims on appeal: 2 - 4

Claims withdrawn from consideration by the Examiner: 1 and 5 - 8.

10/630,282

A01395

(F) Status Of Amendments

Appellants filed an Amendment after Final Rejection on April 16, 2007. The Advisory Action mailed on May 23, 2007 did not indicate whether or not the Amendment would be entered for purposes of appeal. However, as the proposed amendment was strictly for clarification and at the suggestion of the Examiner, the claims presented and argued herein include the amendments made in the Amendment after Final Rejection.

10/630,282

A01395

(G) Summary of Claimed Subject Matter

Claim 2. The present invention provides a cyclopropane compound selected from the group consisting of: [Page 3, line 9 to Page 4, line 1]

**V****VI****VII****VIII**

and

wherein:

- a) each R^1 , R^2 , R^3 , and R^4 is independently a group of the formula: [Page 4 line 8 to Page 4 line 13]

- i) p is an integer from 3 to 10;
q is an integer from 4 to 11;
n is an integer from 0 to 12;
- ii) each L is independently selected from a member of the group D, E, or J
[Page 4, line 14 to Page 5, line 15]
D is of the formula:

10/630,282

A01395

E is of the formula:

J is of the formula:

A) each X and Y is independently a group of the formula:

and

B) m is an integer from 0 to 8; and

C) no more than two E groups are adjacent to each other and no J groups are adjacent to each other;

10/630,282

A01395

iii) each Z is independently selected from: [Page 5, line 16 to Page 6, line 13]

A) hydrogen, halo, cyano, nitro, nitroso, azido, chlorate, bromate, iodate, isocyanato, isocyanido, isothiocyanato, pentafluorothio, or

B) a group G, wherein G is an unsubstituted or substituted; unsaturated, partially saturated, or saturated; monocyclic, bicyclic, tricyclic, or fused; carbocyclic or heterocyclic ring system wherein;

1) when the ring system contains a 3 or 4 membered heterocyclic ring, the heterocyclic ring contains 1 heteroatom;

2) when the ring system contains a 5, or more, membered heterocyclic ring or a polycyclic heterocyclic ring, the heterocyclic or polycyclic heterocyclic ring contains from 1 to 4 heteroatoms;

3) each heteroatom is independently selected from N, O, and S;

4) the number of substituents is from 0 to 5 and each substituent is independently selected from X;

b) W^1 and W^2 are selected from F, Cl, Br, I, alkoxy, acyloxy, alkoxycarbonyloxy, aminocarbonyloxy, alkylaminocarbonyloxy, dialkylaminocarbonyloxy, alkylsulfonyloxy, and arylsulfonyloxy; [Page 6, lines 14-16]

c) provided that at least one of W^1 and W^2 is I; [Page 6, line 17] and

d) the total number of non-hydrogen atoms is 50 or less. [Page 6, lines 18-19]

Such compounds are useful as stable precursors used to generate cyclopropenes which, in turn, are useful to inhibit the ethylene response in plants. [Page 2, lines 10-16, Page 3, lines 1-3 and 6-8]

10/630,282

A01395

(H) Grounds of Rejection to be Reviewed on Appeal

Claims 2 - 4 stand rejected on the ground of obviousness-type double patenting over US 7,041,625 ("625") and US 6,770,600 ("600") in view of Morrison & Boyd, Chapter 6, pp 177-188 ("Morrison & Boyd"); under 35 U.S.C. § 103(a) over US 3,265,745 ("Seyferth"); and under 35 U.S.C. § 103(a) over *J. Chem. Soc. Perkin Trans 1*, 1986, pp1845-1853 ("Baird").

10/630,282

A01395

(D) Argument**Regarding Double Patenting:**

Claims 2-4 are rejected on the ground of obviousness-type double patenting as being unpatentable over claims 1 and 2 of US 7,041,625 ("625") and claims 7-10 of US 6,770,600 ("600") in view of Morrison & Boyd, Chapter 6, pp 177-188 ("Morrison & Boyd").

a. The Appealed Claims 2-4 are Patentably Distinct From the Claims of '600 and '625.

The cited patents, '625 and '600, each disclose the use of cyclopropene compounds to inhibit the ethylene response in plants. '600 discloses a system for the delivery of such cyclopropene compounds to plants. The invention disclosed in '600 does not utilize in any way the compounds of appealed Claims 2-4. As such, the invention disclosed in '600 can easily be practiced in light of Appellants' invention. Appellants' claims would not inhibit one from practicing the invention disclosed in '600 in any way. Conversely, the claims of '600 would not prevent one from practicing the invention of appealed claims 2-4. As a result, as far as '600 goes, there would be no unjustified or improper extension of the right to exclude should Appellants' claims be granted. Therefore, the purpose of a double patenting rejection does not apply as regards '600. '625 relates to the use of compounds of the formulae:

10/630,282

A01395

to inhibit the ethylene response in plants. Compounds of these formulae would be produced by Appellants' method of now withdrawn claim 5 by using the compounds of appealed claims 2-4 as precursor compounds. However, as provided in '625, there are many other methods which can be used to prepare the compounds of the above formulae which do not involve the compounds of appealed claims 2-4. As a result, one could still practice the invention of '625 if Appellants' claims were granted. Conversely, the claims of '625 would not prevent one from practicing the invention of appealed claims 2-4. So again, there would be no unjustified or improper extension of the right to exclude should Appellants' claims be granted.

Appellants' invention provides precursor compounds which can be used in a method to generate cyclopropene compounds which subsequently can be utilized in the inventions of '600 and '625, but would in no way prevent the use of such cyclopropene compounds themselves.

b. The Prior Art Fails to Provide a Motivation to Combine the References so as to Produce the Claimed Invention

Morrison & Boyd merely discloses general reactions of double bonds, including a large variety of reactions that can be used to convert double bonds to saturated bonds. However, there is no teaching or suggestion in Morrison & Boyd that such a process can be used as a method to stabilize a cyclopropene double bond so that the cyclopropene can later be regenerated. The potential energy diagram in Fig 6.3 of Morrison & Boyd cited by the Examiner to support the fact that a saturated bond is more stable than an unsaturated bond only discloses the potential energy relationship for hydrogenation of linear double bonds, not those found in highly strained cyclic compounds such as cyclopropenes. Appellants' invention is compounds which can serve as cyclopropene precursor compounds. Nothing in Morrison & Boyd would lead one skilled in the art to take the cyclopropene compounds disclosed in '625 and '600 and convert them to their saturated cyclopropane analogs with the expectation that the cyclopropene compound would then be subsequently regenerated from the cyclopropane analog. This, in effect,

10/630,282

A01395

would add two additional steps to utilize the inventions disclosed in '625 and '600. For these reasons, it would not have been obvious to one skilled in the art to perform such reactions.

Regarding rejection 1 under 35 U.S.C. § 103(a) over US 3,265,745 ("Seyferth"):

Claims 2-4 are rejected under 35 USC §103(a) as being unpatentable over Seyferth et al (US Patent 3,265,745) in that Seyferth discloses dihalocyclopropanes.

The Prior Art Fails to Provide a Motivation to to Produce the Claimed Invention

The disclosure of Seyferth would not motivate one skilled in the art to prepare Appellants' cyclopropane compounds. Contrary to the statement in the Office Action, Seyferth discloses *gem*-dihalocyclopropanes, not 1,2-dihalocyclopropanes. The Examiner has cited Seyferth, col. 1, lines 23-27, as teaching such 1,2-dihalo compounds. Appellants respectfully submit that the Examiner is missreading the reference. The Examiner states that col.1, lines 23-27 teaches: "1,1-dihalo cyclopropanes means either 1,1 dihalo cyclopropane itself or compounds having substituents on either of the other two carbon atoms in the cyclopropene ring" and that this is a teaching of 1,2-dihalocyclopropanes. In fact, Seyferth states: "By the term 1,1 dihalocyclopropanes it is meant either 1,1-dihalocyclopropane itself or compounds having substituents on either one or both of the other two carbon atoms in the cyclopropane ring, i.e., the carbon atoms numbered 2 and 3 in the cyclopropane ring." It is Appellants' position that this statement defines 1,1-dihalocyclopropane or a 1,1-dihalocyclopropane with additional substituents on one or more of the 2 and 3 positions, not a 1,2-dihalocyclopropane. Seyferth clearly teaches and, in fact requires, cyclopropanes that must be 1,1-dihalo substituted, i.e., compounds in which both of the key halo substituents are on the same carbon. These are significantly different from the 1,2-substituted cyclopropanes of Appellants, i.e., compounds in which the key halo substituents are on adjacent carbons. There is no teaching or suggestion in Seyferth that would motivate one skilled in the art to prepare 1,2-disubstituted cyclopropanes. The motivation of Seyferth was to provide a novel route to 1,1-dihalocyclopropanes (see col. 1, lines 10-12). Seyferth's method always results in the formation of a *gem*-dihalo -substituted three membered ring compound because the

10/630,282

A01395

method generates a dihalocarbene adduct which adds to a double bond (see col. 2, lines 10-12 and col 3, lines 23-24 and 35-37). Appellants' compounds, on the other hand, require a 1,2-substituted cyclopropane.

Furthermore, there is no suggestion that such compounds are useful precursors for the production of cyclopropenes with ethylene inhibition activity. The *gem*-dihalosubstituted compounds of Seyferth are used for entirely different purposes (see col. 5, line 59 to col. 6, line 2) and, in fact, cannot be converted to the cyclopropenes of Appellants' Structures 1-IV using Appellants' processes (see withdrawn claim 5). As a result, one skilled in the art and familiar with Seyferth would not be motivated to prepare Appellants' compounds.

Regarding rejection 2 under 35 U.S.C. § 103(a) over *J. Chem. Soc. Perkin Trans 1*, 1986, pp 1845-1853 ("Baird")

Claims 2-4 are rejected under 35 USC 103(a) as being unpatentable over Baird et al. *J. Chem. Soc. Perkin Trans 1*, 1986, pp 1845-1853 ("Baird") in that Baird teaches addition of substituents to cyclopropenes to prepare cyclopropanes.

The Prior Art Fails to Provide a Motivation to to Produce the Claimed Invention

Baird teaches the preparation of 1-halocyclopropenes by treatment of 1,1,2-trihalocyclopropanes with methylolithium. Throughout the reference, Baird teaches that "halogen = bromine, chlorine". There is no disclosure, teaching, or suggestion that the halogen can be iodo. All of Appellants' claimed compounds require at least one iodo substituent (as substituents labeled W1 and/or W2). Baird teaches the preparation of 1-halogenocyclopropenes from 1,1,2-trihalogenocyclopropanes (halogen = bromine, chlorine) which are then lithiated by lithium-halogen exchange to give 1-lithiocyclopropenes which are then trapped by electrophiles (See the abstract.) Baird's motivation was: "... part of a broad examination of the chemistry of tri- and tetra-halogenated cyclopropanes...". (See p. 1845, second paragraph.) Thus, the motivation of Baird, to form a 1-halogenocyclopropene, where the halogen is bromine or chlorine, to be subsequently converted to a 1-lithiocyclopropene in a study of reaction chemistry, is significantly different from that of Appellants. Appellants' motivation is to provide

10/630,282

A01395

stable precursors of cyclopropenes by converting the cyclopropenes to iodo-substituted cyclopropanes, which can subsequently be converted back to the cyclopropenes (see the Specification page 2, lines 17-21) using the method of withdrawn claim 5. The cyclopropene is then subsequently used to antagonize the ethylene response in a plant using the method of withdrawn claim 8. Appellants respectfully submit that the prior art could not have suggested to one skilled in the art stabilization of unstable cyclopropene molecules by converting them to their more stable cyclopropane analogs. Appellants claims 2 - 4 are claims to such stable cyclopropane analogs.

CONCLUSION

Based on the foregoing, Appellants respectfully submit that the pending claims are currently in condition for allowance. Appellants respectfully request the Board to pass the pending claims to allowance.

Enclosed herewith, Appellants have filed a Certificate of Mailing to establish the timely filing of this Appeal Brief.

The Commissioner is hereby authorized to charge any additional fee which may be required, or to credit any overpayments to Deposit Account 18-1850.

Respectfully submitted,

(J) Claims Appendix

2. (Currently Amended) A cyclopropane compound comprising a structure selected from the group consisting of:

**V****VI****VII**and**VIII**

wherein:

a) each R^1 , R^2 , R^3 , and R^4 is independently a group of the formula:

i) p is an integer from 3 to 10;

q is an integer from 4 to 11;

n is an integer from 0 to 12;

ii) each L is independently selected from a member of the group D, E, or J

D is of the formula:

10/630,282

A01395

E is of the formula:

J is of the formula:

A) each X and Y is independently a group of the formula:

and

B) m is an integer from 0 to 8; and

C) no more than two E groups are adjacent to each other and no J groups are adjacent to each other;

10/630,282

A01395

iii) each Z is independently selected from:

- A) hydrogen, halo, cyano, nitro, nitroso, azido, chlorate, bromate, iodate, isocyanato, isocyanido, isothiocyanato, pentafluorothio, or
 - B) a group G, wherein G is an unsubstituted or substituted; unsaturated, partially saturated, or saturated; monocyclic, bicyclic, tricyclic, or fused; carbocyclic or heterocyclic ring system wherein;
 - 1) when the ring system contains a 3 or 4 membered heterocyclic ring, the heterocyclic ring contains 1 heteroatom;
 - 2) when the ring system contains a 5, or more, membered heterocyclic ring or a polycyclic heterocyclic ring, the heterocyclic or polycyclic heterocyclic ring contains from 1 to 4 heteroatoms;
 - 3) each heteroatom is independently selected from N, O, and S;
 - 4) the number of substituents is from 0 to 5 and each substituent is independently selected from X;
 - b) W^1 and W^2 are selected from F, Cl, Br, I, alkoxy, acyloxy, alkoxycarbonyloxy, aminocarbonyloxy, alkylaminocarbonyloxy, dialkylaminocarbonyloxy, alkylsulfonyloxy, and arylsulfonyloxy;
 - c) provided that at least one of W^1 and W^2 is I; and
 - d) the total number of non-hydrogen atoms is 50 or less.
3. (Original) The compound of claim 2 wherein each of W_1 and W_2 are I.
4. (Original) The compound 1,2-diiodo-1-methylcyclopropane.
